The algebraic study of **PI** group rings was initiated in 1949 by I. Kaplansky, but it did not really catch on until the fundamental work of S. A. Amitsur appeared some ten years later.

After the fundamental work of Amitsur and the interest in rings with involution developed from the 1970s by Herstein and collaborators, it is natural to consider group algebras from this viewpoint.

From now on we will consider a $\sigma: G \to \mathcal{U}(\mathbb{F})$.

Let $\zeta = \zeta(G)$ denote the center of group G. In [GS93] it was proved that if * is the classical involution and ζ^2 is infinite, and if $\mathbb{F}G^+$ or $\mathbb{F}G^-$ is Lie nilpotent of index n, then also $\mathbb{F}G$ is Lie nilpotent of index n. Recently in [CP12] Castillo and Polcino Milies obtained for *oriented classical involutions*:

Theorem (Castillo-Polcino Milies, 2012)

Let G be a group s.t $|\zeta^2(G)| = \infty$. Then, $\mathbb{F}G^+$ or $\mathbb{F}G^-$ is Lie nilpotent of index n if and only if $\mathbb{F}G$ is Lie nilpotent of index n.

From the last theorem and the main result in [BP06] we get immediately:

Corollary

Suppose that $\mathbb{F}G$ and $\mathbb{F}G^+$ satisfy the above conditions and, N is not an LC-group. Then, the following conditions are equivalent:

- (i) $\mathbb{F}G^+$ is Lie n-Engel;
- (ii) $\mathbb{F}G^+$ is a subring in $\mathbb{F}G$;
- (iii) $\mathbb{F}G$ is a normal group algebra.

Currently, Castillo, Holguín and Polcino Milies are investigating (in preparation) which properties of Lie known for any involution * defined on a group G and for the oriented classical involution, may be generalized to oriented group involutions.

We give some results where the involution of G is arbitrary. We highlight that some previous results from [GPS09], cannot be extended with a nontrivial σ .

Lemma

Let G be a group without elements of order 2, $char(\mathbb{F}) > 2$. If $\mathbb{F}G^+$ is Lie n-Engel, then P is a subgroup. Moreover, G/P is abelian or N/P is abelian and $(G \setminus N)/P \subseteq (G/P)^+$.

Now an oriented version of Lemma 2.8 in [GPS09]:

Lemma

Let \mathbb{F} be a field of $car(\mathbb{F}) > 2$. If $\mathbb{F}G^+$ is Lie n-Engel under oriented group involution \star and, if $g \in N^+$, then $g^{p^m} \in \zeta(G)$, for some m.

A result showing the impossibility of $\sigma \not\equiv 1$:

Theorem

Let G be a finite group of even order. Assumme that G/P is abelian. If $(FG)^+$ is Lie n-Engel, then N is nilpotent. Moreover, if $\zeta(G)=1$, then $G\cong P\rtimes \big\{g\in G:\sigma(g)=1\ e\ g^2=1\big\}$.
